

Soccer Career RPG

One-page repo summary

Godot 4.x

GDScript

v0.1.0

What it is

Soccer Career RPG is a Godot 4 tactical soccer game that mixes player creation, turn-based matches, season progression, and narrative systems. The repo centers on a high school career arc in Japan, with optional AI-assisted storytelling and local template fallback.

Who it is for

Explicit target persona: **Not found in repo.** Closest repo evidence points to players who want anime-style soccer, tactical turn-based play, and career-mode RPG progression.

What it does

- Creates a custom player with position, nationality, appearance, traits, and prefecture selection.
- Runs a Japanese high school season with league, qualifiers, nationals, standings, and scheduling.
- Lets you play or simulate 11v11 hex-grid tactical matches with turn phases, formations, AI, and substitutions.
- Tracks stats, XP, levels, stamina, form, skills, milestones, and reputation over a career.
- Includes free kick, penalty, and rondo drills that award XP and stat growth.
- Presents career systems through both a console dashboard and a retro desktop shell with apps and notifications.
- Generates post-match, news, and social content through NarrativeEngine, with optional AI config and local templates.

How it works

- Entry flow: main_menu.tscn leads to character creation or load-game scenes, then into the dashboard, desktop shell, career hub, training, and match scenes.
- Core services: GameManager owns app state; SeasonManager builds the current school season; StatSystem, CareerManager, SaveManager, DesktopManager, NarrativeEngine, PersonaManager, NpcRegistry, and SocialFeedManager run progression and support systems.
- Data flow: character creation builds PlayerData and a team, matches and drills update stats/reputation/social/narrative state, and SaveManager writes player, team, career, season, narrative, persona, NPC, social, and settings data to user://saves/. NarrativeEngine reads user://ai_config.json when present and otherwise uses local templates.

How to run

- Install Godot 4.x. README lists Godot 4.2+ as the prerequisite.
- Open and import project.godot in the Godot editor.
- Press F5 to launch the main menu.
- Optional: create user://ai_config.json to enable AI narrative; template fallback is built in.
